GS-Base is a software application designed to help you organize your information into tables without having to possess previous database knowledge. It comes with an impressive set of built-in formulas useful for calculating field values, pivot tables for processing large amounts of data, as well as editing and formatting tools. User interface For those users accustomed to working with spreadsheets, the

GUI comes as no surprise. It delivers a robust yet very practical and intuitive layout for a better management of different types of data, such as numbers, plain text fields, long formatted text documents, images and files. Creating a new database proves to be a straightforward task that only requires from your part to enter a name, pick data type (text, number, long text, images/files), and enter user-defined fields. Additionally, you may import info from CSV, ZIP, TXT, TSV, TAB, HTML, XML or DBF file format. Database editing features GS-Base gives you the possibility to add, delete and

update fields, rearrange fields and tables, rename them, as well copy the information between different tables. The tool lets you change the text in terms of font, color, style and alignment, insert date and time stamps, add new records, delete fields, undo or redo your actions, print the table, and add images (PNG, JPEG, GIF, BMP, TIF, ICO). Pivot tables

One of the best options included on the feature list enables you to quickly get and visualize statistical information about your data, including counting, summarizing, sorting or finding partial maximum/minimum and mean values. Other handy features

and configuration settings to play with GS-Base allows you to perform advanced searches for quickly identifying data within a table, sort items in an ascending or descending order, send emails to all found recipients or to the selected one, export data to PDF file format, look for duplicate items, and merge records. When it comes to security options, you can password-protect the sensitive information included in the program with the aid of a master password. Configuration settings allow you to specify an undo and redo level, pick the default text field filter (e.g. regular expression, greater than,

between) and pivot function (e.g. sum of positive or negative values), choose the default file extension, show list of files attached to the database, and enable the automatic saving function. According to a common belief, Oracle reigned as king of database tools for years because it was a perfectly reliable environment. It 09e8f5149f

function1. Field of the

Invention The present invention

relates to an object detection

device and an object detection

method which detect the

presence or absence of an

object within a specific range

in a monitored area,

particularly to an improved object detection device and an object detection method which detect the presence or absence of an object using a light-receiving/light-emitting (LED) unit and a light-emitting diode.

2. Description of the Related Art A conventional object detection device which detects the presence or absence of an object within a specific range in a monitored area is disclosed in JP, A, 4-211193. The object detection device has a first LED array including a plurality of LEDs which are disposed to form a lattice-like arrangement in a monitored area, a second LED array including a plurality of LEDs which are disposed to

form a lattice-like arrangement in the monitored area, and an image processing means. The first LED array is turned on or off in accordance with a first light-receiving signal from the image processing means, and the second LED array is turned on or off in accordance with a second light-receiving signal from the image processing means. The image processing means compares the outputs from the first and second LED arrays to detect the presence or absence of an object within the monitored area based on the comparison results. The first and second LED arrays are formed by providing a separate set of LEDs in an array

corresponding to a monitored area. If it is required to detect the presence or absence of an object within a plurality of monitored areas, two sets of the first and second LED arrays are required to be provided for the monitored areas. Further, if it is required to detect the presence or absence of an object within a wide monitored area, many LED arrays are required
